

AI PAPER TRADING WITH BUILT-IN RISK CHECKS

AI explains the trade. Code controls the money.

The base portfolio holds the account. AI may research a small options trade; fixed code caps its loss and can still stop the order.

THE PROBLEM

A trading bot is hard to trust when one model can research, size, and send.

COMMON AGENT

FINLY

Useful AI judgment—without handing the model the account keys.

Finly's rules choose the maximum risk, the exact option pair, the order details, and whether a trade may be sent.

AI explains the opportunity. Rules decide whether money can move.

02 RISK RULES

Set the loss and build

03 FINAL CHECK

Send to Alpaca—or stop

Market Trend
Recent prices have been falling, and heavier trading gives modest support to that signal.

Options Prices
More traders are paying to protect against a price drop. That supports a negative view, but not an extreme one.

Economic Events
An upcoming economic report raises the chance of weaker short-term growth.

Prediction Markets
A public prediction market points the same way.

Finly reads the evidence as a **falling-price view**. It then builds a capped-loss trade and checks every term before preparing the paper order.

WHAT FINLY SEES The market view AI compares the supplied information and explains why it supports—or weakens—the trade idea.	WHAT FINLY BUILDS A two-option trade with capped loss Code—not the language model—chooses the contracts, position size, possible gain, and maximum loss.
WHAT THE TESTS FOUND The thesis held up Finly removes each source and nudges the inputs before it trusts the original conclusion.	WHAT HAPPENS NEXT Ready for paper trading Every field in the Alpaca paper order is now fixed and ready for review.

DECISION
A trade with a fixed maximum loss is ready for review.

Finly turned the supported idea into a complete Alpaca paper-order plan, including the position size, maximum gain, and maximum possible loss.

Illustrative options example; no broker order or fill occurred. The live paper account is shown separately above.

The model may explain or veto. It cannot choose size or write the broker order.

HISTORICAL REPLAY

\$10,000 became \$106,711: \$38,629 ahead of SPY.

Finly's base portfolio holds roughly half in QQQ, a Nasdaq-100 fund, half in three trend-selected sectors, and 3% in cash.

Market Trend

Recent prices have been rising.

Options Prices

Prices for time-limited market contracts mildly favor a rise.

Economic Events

An upcoming economic report points the other way.

Prediction Markets

A public prediction market disagrees with the price data.

Finly initially reads the evidence as an **undecided market view**, but the case falls apart under testing. Instead of forcing a trade, it keeps the account protected.

WHAT FINLY SEES The market view AI compares the supplied information and explains why it supports—or weakens—the trade idea.	WHAT FINLY BUILDS No trade was built Code—not the language model—chooses the contracts, position size, possible gain, and maximum loss.
WHAT THE TESTS FOUND The thesis broke down Finly removes each source and nudges the inputs before it trusts the original conclusion.	WHAT HAPPENS NEXT No trade; capital stays untouched The process stops before the paper account takes on any risk.

DECISION

No trade. The account stays untouched.

The evidence test failed, so Finly stopped before the paper account took on any risk.
