

FINLY

AI TRADING WITH BUILT-IN RISK CHECKS

Finly shows its work before it trades.

It reads market evidence, builds a defined-risk paper trade, and lets code—not the model—decide whether the order reaches Alpaca. In our historical test, \$10,000 became \$106,711—\$38,629 more than SPY.

Bruce Wen | Brandeis University | owlsowo.github.io/finly-bot

\$10,000 became \$106,711—\$38,629 more than SPY.

2013–2026 HISTORICAL TEST

♦967.11%

FINLY MODELED TOTAL RETURN

SPY total return	+580.82%	SPY
Ending-wealth advantage	\$38,629	MORE
Modeled one-way costs	5 bp	COST
Identical test window	2013–26	13Y

Same \$10,000 · same dates · 2013-01-02–2026-08-27 · 5 bp modeled one-way costs · historical test, not live account results.

Most trading agents let one model do too much.

ONE MODEL

Researches, sizes, and sends the order.

If the same model reads the evidence, picks the exposure, and writes the order, one confident mistake can put capital at risk.

FINLY

AI researches. Code controls the order.

AI explains the market view. Code sets position size, maximum loss, option legs, and every broker field. A final check can still stop the trade.

The model can explain a trade. It cannot give itself permission to place one.

A fixed industry proxy carried the idea across 80 earlier years.

If the evidence or the numbers change, Finly stops the trade.

Every Finly decision comes with a receipt.

WHAT'S IN THE RECEIPT

**The evidence, the trade, the risk,
and the result.**

A judge can see what the AI concluded, what code built, what changed during testing, and what happened next. The receipt links back to the data and code behind it.

Open the receipt or run the tests yourself.
